

THE ETHICS OF SCIENTIFIC PUBLICATIONS

For reviewers:

- a manuscript, received for reviewing must be considered to be a confidential document which can't be given for acquaintance or discussion to the third party, having no authority for this;
- a reviewer must give objective and reasonable valuation of research, personal criticizing of an author is unacceptable;
- not published data, received from presented manuscripts must not be used by a reviewer for personal aims;
- a reviewer which doesn't have in his opinion enough qualification for the valuation of the manuscript or can't be objective, for example, in the case of conflict of interests with an author or an organization, must inform the editor about his expel from the process of reviewing this manuscript.

For authors:

- an author presents to the editorial office utterly original article;
- in the case of using statements of other authors it is necessary to give bibliographical references;
- an author should not present a manuscript of an article which has been already published and must not give one and the same article to the editorial offices of several magazines simultaneously.
